

Introduction to Global IDs

Data Ecosystem
Evolution Platform

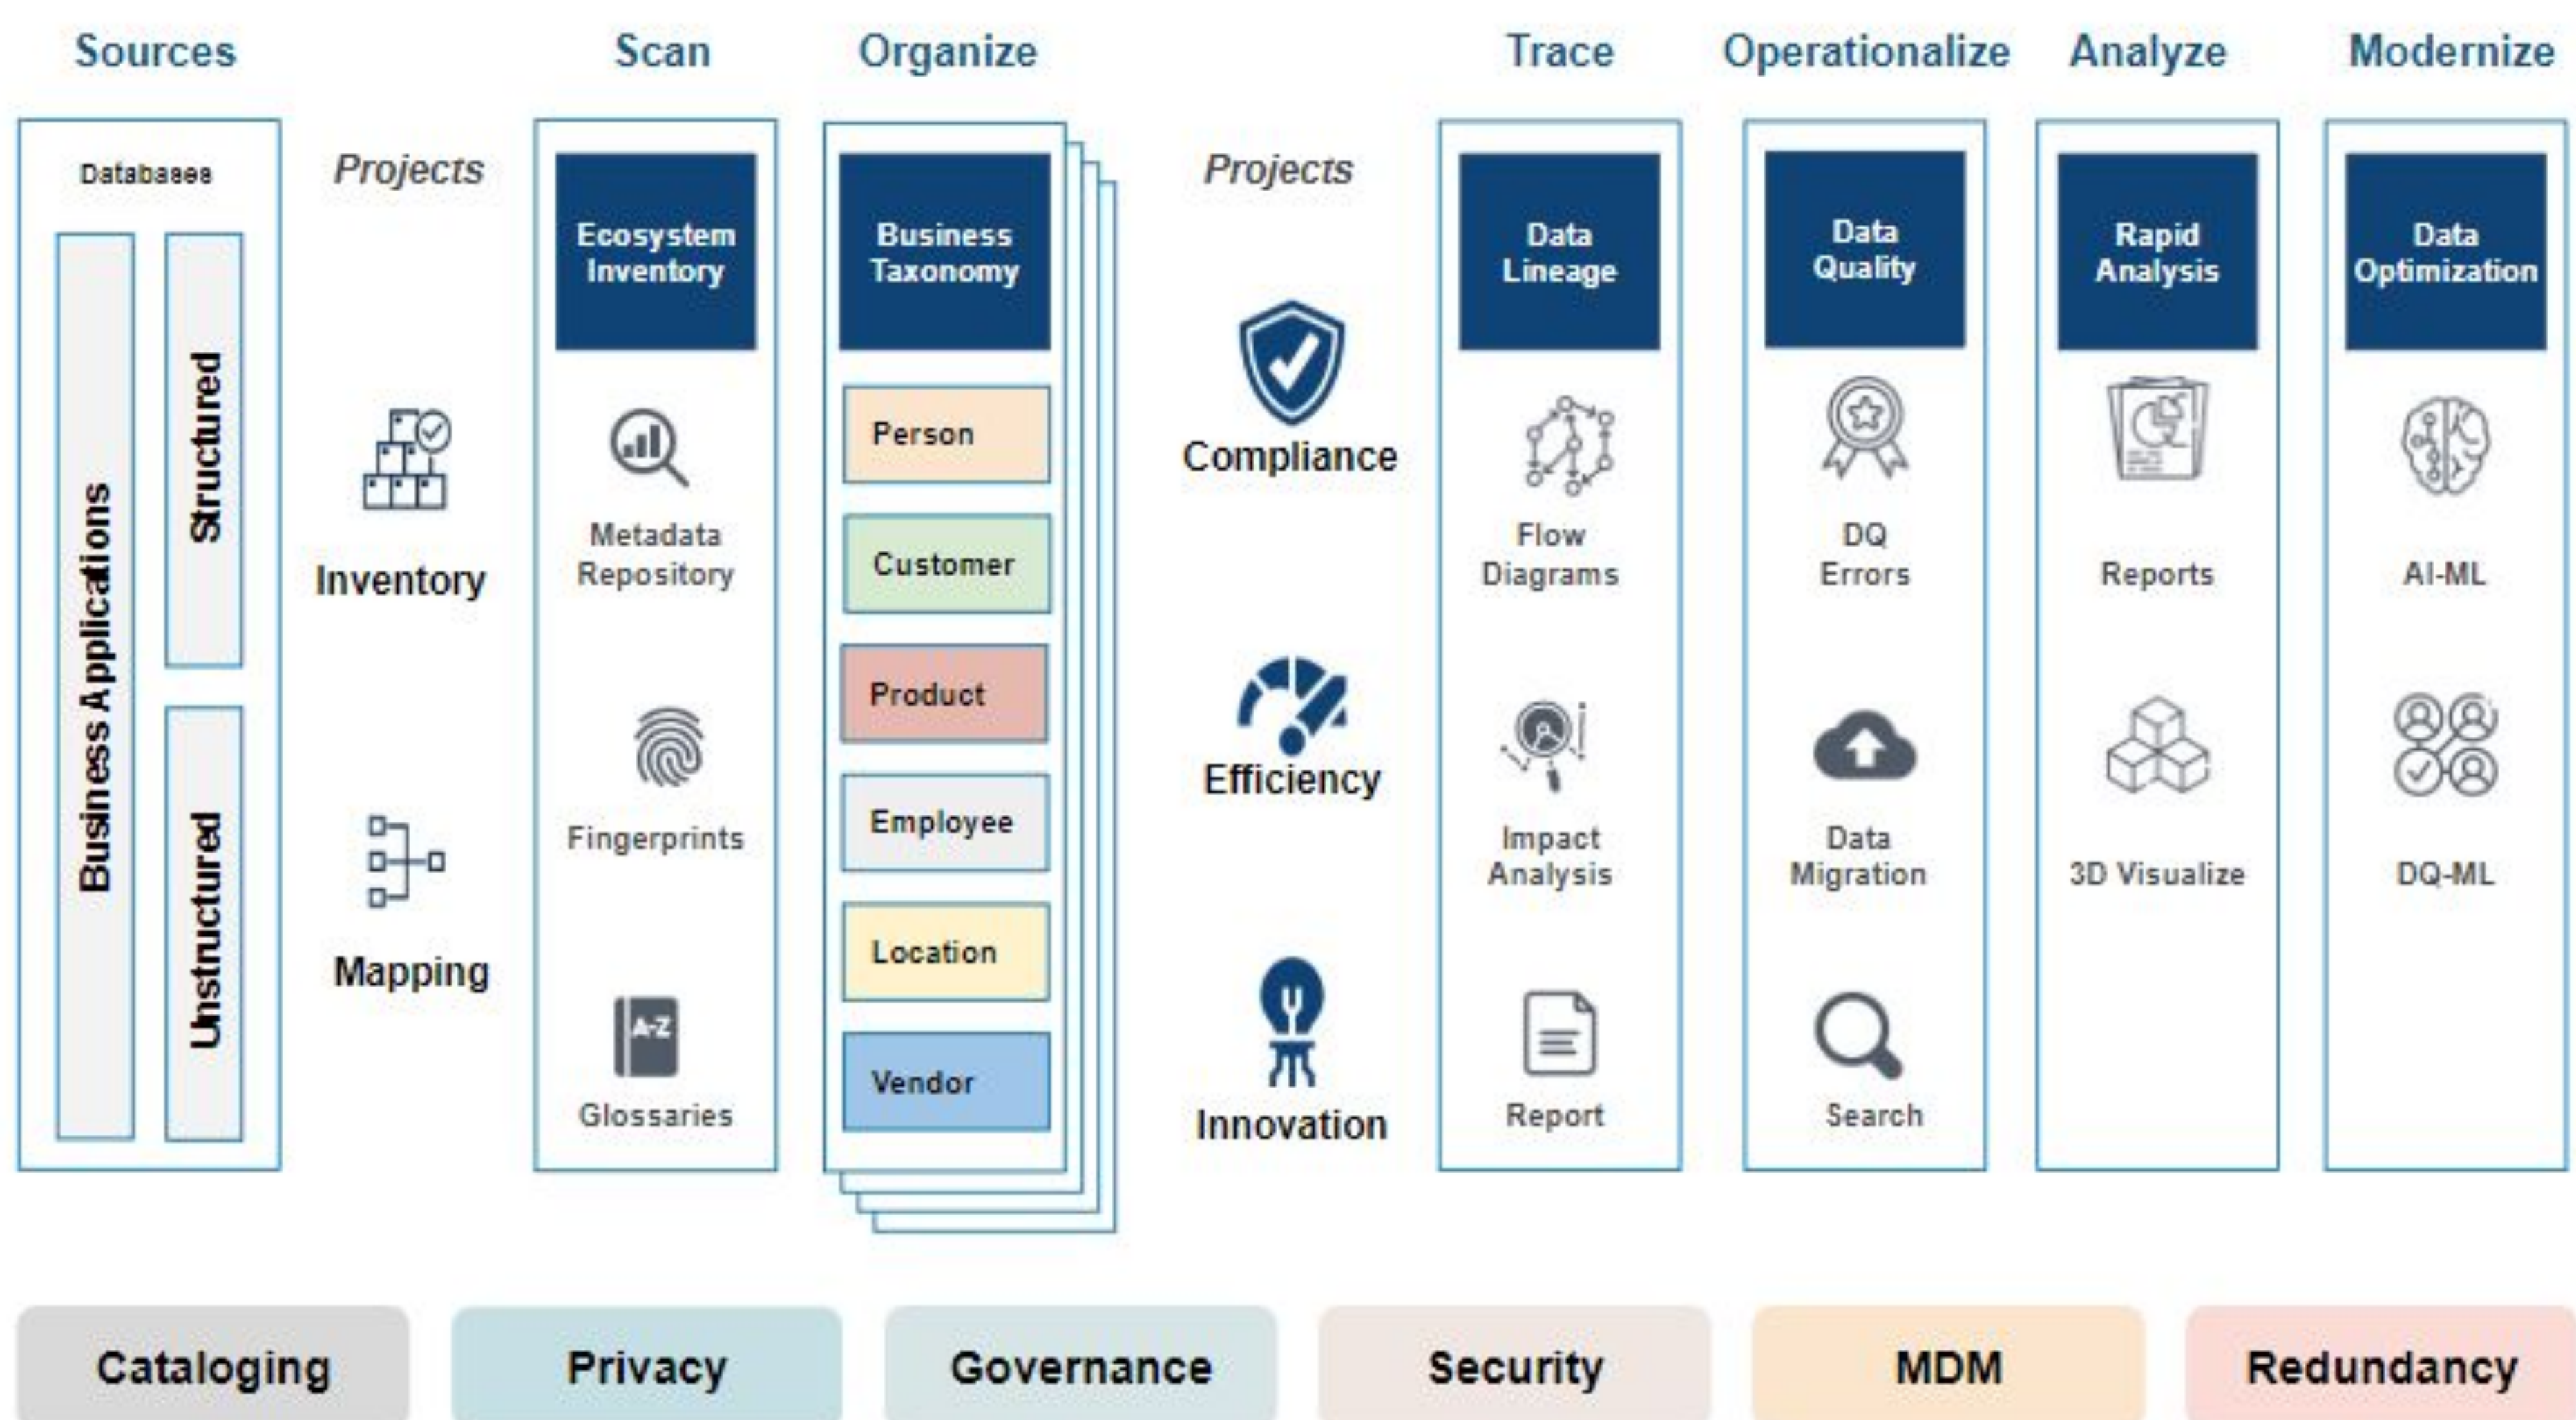

Global IDs creates software to help businesses extract value from their Data Ecosystems.

Our customers use our software to

1. Organize their information assets
2. Execute projects related to Data Governance, Data Privacy and Regulatory Compliance.

Using our software, data-centric projects can be completed faster, better and cheaper compared to manual approaches.

Our software platform (Data Ecosystem Evolution Platform) was developed over two decades, and is unique in its ability to scale. Most of our customers are market leaders in their respective industries, and possess some of the largest, most complex data environments in the world.

More recently, we have developed a unique capability to search and trace a single data value as it flows through the data ecosystem. Having the ability to trace a single transaction flow through hundreds of applications in a complex enterprise can be empowering. Each step of the journey of the transaction can be operationally verified and detailed data quality checks can be applied.

We would welcome the opportunity to participate in your data modernization initiatives, and create business outcomes that you can be delighted with. Please reach out to info@globalids.com so that we can engage in a conversation.
